

Base station communication equipment construction includes

Overview

Base stations contain several key parts. The transceiver handles signal modulation. The cabinet houses critical components like main base station equipment, transmission equipment, power supply systems, and battery banks. It usually connects the device to other networks or devices through a dedicated high bandwidth wire or fiber optic connection. First, the base station uses its tall antennas to transmit and receive electromagnetic waves, which we commonly call "mobile phone signals. Positioned closest to end users, they serve as gateways for processing customer requests and managing data flow.
