

# Battery Energy Storage System of Institute of Chemistry

## Overview

---

This chapter covers the basics of electrochemical energy storage systems. The most important variants—lead-acid batteries, nickel-metal hydride batteries, and lithium-ion batteries—are presented in detail. Apart from Li-ion battery chemistry, there are several potential chemistries that can be used for stationary grid. Battery Energy Storage Systems, or BESS, help stabilize electrical grids by providing steady power flow despite fluctuations from inconsistent generation of renewable energy sources and other disruptions. While BESS technology is designed to bolster grid reliability, lithium battery fires at some. CEI researchers are pushing the envelope on batteries that can store much more energy than current lithium-ion cells. The goal is to develop breakthrough, but low-cost, materials and battery designs that can fully utilize new high-performing materials. It can reduce generation capacity and transmission costs by storing energy during periods of excess generation and saving it for when that energy is needed, enabling systems that rely on.
