

# Calculation of air intake and exhaust in the generator silent room

## Overview

---

Because of that, engineers use a design sheet to calculate how much fresh air is required and how much heat needs to be removed. When diesel generator room adopts clean ventilation, Please calculate the intake air volume and the exhaust air volume as follows: When the diesel generator room is water cooled, It is calculated according to the ventilation required that eliminate harmful gases in the diesel generator room. When ever possible, face the generator. Generator room air inlet and outlet shaft spac velocities and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and transformers. The documents contain calculations for sizing ventilation systems for generator rooms.
