## Overview

---

Resilience, efficiency, sustainability, flexibility, security, and reliability are key drivers for microgrid developments. These factors motivate the need for integrated models and tools for microgrid planning, design, and operations at higher and higher levels of. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. NLR has been involved in the modeling, development, testing, and deployment of microgrids since 2001. A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. It can connect and disconnect from the grid to. Microgrids are gradually making their way from research labs and pilot demonstration sites into the growing economies, propelled by advancements in technology, declining costs, a successful track record, and expanding awareness of their advantages. Additionally, they reduce the load on the utility grid. However, given that they depend on unplanned environmental factors, these systems have an unstable generation. This whitepaper provides an excellent starting point for microgrid discovery and development processes, highlights key implementation and operation challenges and solutions while emphasizing the essential role of Microgrid Energy Management Systems.
