

# Photovoltaic panel with water tank in the middle

## Overview

---

A research group from Ireland developed a PVT system consisting of a 170 W photovoltaic panel connected to a water tank placed at the backside of the PV module itself. Imagine turning that unused water reservoir into a power plant that literally cools itself while generating electricity. Talk about multitasking! Let's. Their building is a classic 04-storeyed all-white structure with arched balconies across every room located on every floor. This design is also replicated onto the terrace slab, which serves as a major stress-busting area for its residents to relax and recreate with yoga and other exercises. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1. Pairing solar panels with unconventional surfaces like convex water tanks. But wait, can these two systems truly work in harmony?

Let's break down the technical realities and innovative approaches making this possible. The Dualsun's SPRING4 hybrid PVT panels generate both electricity and hot water and can be directly integrated with an existing domestic hot water tank or pool heating system. This is a simple, effective and cost-saving solution for buildings in warm regions (not Nordic countries where a heat pump).
