

Swiss energy storage participates in frequency regulation

Overview

Since the battery energy storage does not participate in the system frequency regulation directly, the task of frequency regulation of conventional thermal power units is aggravated, which weakens the ability of system frequency regulation. This paper proposes an analytical control strategy that enables distributed energy resources (DERs) to provide inertial and primary frequency support. A reduced second-order model is developed based on aggregation theory to simplify the multi-machine system and facilitate time-domain frequency. Energy storage has emerged as a crucial component in frequency regulation, providing a flexible and responsive resource to balance supply and demand. In this article, we will explore the role of energy storage in frequency regulation, the various energy storage technologies used, and the strategies. Swiss Green Electricity Management Group (SGEM), an investor in energy storage projects, has announced a 20MW / 10MWh battery storage system for PJM Interconnection's frequency regulation market, to be supplied and built by Leclanché. However, the operating cost of energy storage is still high at this stage.
