

# The cheapest way to generate solar power

## Overview

---

On a global, utility-scale level, the cheapest way to generate electricity in 2025 is unequivocally from new onshore wind farms and utility-scale solar photovoltaic (PV) plants. The emergence of renewable energy like wind and solar as a viable alternative to oil, gas and other fossil fuels has raised critical questions about which form of power offers the best value today — a debate made all the more urgent by the ravages of climate change. For an individual homeowner, installing a rooftop solar system is now often the cheapest long-term method for producing. Even without subsidies, renewables are often the cheapest option available. This chart, created in partnership with the National Public Utilities Council, shows which electricity sources are the most and least expensive in 2024, using data by Lazard. Onshore wind power effectively costs \$0 per. Here is a breakdown of the cost of renewable energy according to our research, ranked by least to most expensive: Compare these costs to ultra-supercritical coal, which costs \$72.78 per megawatt-hour, more than double the cost of solar energy. We'll discuss all the factors like installation costs, long-term savings, and sustainability to help you make informed decisions for your home.
