

The difference between distributed power grid and microgrid

Overview

The difference between distributed generation vs microgrid is clear: Distributed generation is about single, decentralized power sources. The two terms sound similar, but they are not the same. Examples include rooftop solar, small wind turbines, natural gas. Two ways to ensure continuous electricity regardless of the weather or an unforeseen event are by using distributed energy resources (DER) and microgrids. DER produce and supply electricity on a small scale and are spread out over a wide area.

Solar Integration: Distributed Energy Resources and Microgrids

Distributed Energy Resources Islands and Microgrids Black Start Additional Information Distribution grids are vulnerable to outages that can affect large regions and millions of people and businesses, particularly as a consequence of extreme, destructive weather events. When parts of the grid are equipped with DER, they can continue serving other loads on the same distribution network, meeting local needs with local generation.
