

Uncertainty in microgrids

Overview

Smart microgrids are considered an effective way to solve this problem. Existing studies exhibit limitations in prediction accuracy, Alternating Current (AC) power flow modeling, and integration with optimization frameworks. This paper proposes a closed-loop technical framework combining. Microgrids, particularly dynamic networked microgrids (DNMGs), offer a promising solution to mitigate the impacts of such contingencies and enhance resiliency. However, distribution networks present unique challenges due to their unbalanced nature and the inherent uncertainty in both loads and. The randomness, volatility, and intermittency of renewable energy sources such as wind and solar energy present significant challenges to energy management in microgrids, resulting in low management efficiency and poor accuracy.
