

# What are the disadvantages of wind blade generators

## Overview

---

Wind energy's disadvantages include intermittency requiring backup power or storage, visual and noise impacts, land use, wildlife effects, and end-of-life composite blade waste disposal challenges. One big disadvantage of wind energy is that no matter how great the technology becomes, a wind turbine will never be able to be more than 59.3% efficient according to Betz's Law. Betz's law states. While the construction of wind turbines releases more greenhouse gases than building a coal or gas power plant, turbines are virtually emission-free once in operation, a claim fossil fuel plants cannot make. Because wind is a renewable resource, it will not run out. No pollution during operation This form of energy is incredibly environmentally friendly.
