

Where can I check the generator air inlet temperature

Overview

Many modern generators include temperature gauges or warning lights. To pull a rated full load between 40°C (104°F) and 50°C (122°F). The cooling systems are designed to operate in these ambients, and when enclosed, the canopy design has to allow the correct amount of air in and out. It is important to ensure that the ambient air capability is adequate for the site as operating above the rated ambient air. When specifying a generator set with an enclosure for use in a hot climate, outside air temperature defines the ambient capability. Manufacturers recommend maintaining at least 3-5 feet of clearance on all sides for adequate ventilation. Engine oil serves as both lubricant and.
